AutoCAD History AutoCAD, which came to be on November 26, 1982, was the first CAD application for personal computers. AutoCAD runs on a host operating system, such as Windows, macOS, or Linux. For the first few years after its initial release in 1982, AutoCAD was available only on microcomputers with internal graphics controllers. During the early years of AutoCAD, it had no library functions, no symbol management, no annotations, no reference tools, and no intelligent graphics tools. In the early 1980s, many computer-aided design (CAD) programs were developed for mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. During the late 1980s and early 1990s, AutoCAD was introduced in the field of architecture, with the following steps in the process: Design-development work for a project team, including concept development, design development, and documentation. AutoCAD for Architecture The following describes the steps in an architectural design-development project using AutoCAD. During the concept-development phase, a conceptual design of a project is developed. At this time, a team of architects and structural engineers conceptualizes the various parts of the project. One or more structural diagrams of the project are created during the concept development. These diagrams include diagrams of the project site, such as the construction site, the building footprint, and the boundary lines of the site. During the design-development phase, a design of the project is developed based on the conceptual design of the project. The design process includes the drawing and design of the project elements. For the project team, this is a collaborative process
