Select the following tabs. First, select the path where you want the autocad installation folder to be placed. If you are installing in C:\, then the path should be C:\Autodesk\. Click on OK. Select the forum where you would like to download the cracked files and click on OK. Select the language you would like to install Autocad in and click on OK. After the files are downloaded, click on OK and wait for the installation to be completed. You may need to restart your computer to complete the installation. Additional resources Category:Autodesk products Category:Technical communication toolsQ: Matching one character twice in an array I have two arrays, one of words and one of characters which can be used in the words. For example: Words = ["one", "two", "three"] Characters = ["o", "e", "n"] If the word contains a character then it is a valid word, if it doesn't, it is not valid. If the word is valid I want to return the word, but if it isn't valid then I want to return a random word of the same length. This is my code so far: words.each\_with\_index do |word, index| characters.each do |character| if words.include?(character) valid = true break else word2 = characters.sample valid = false end end end I know that this is incorrect, it is just a sketch of what I want. I'm fairly new to Ruby so any help would be greatly appreciated. A: # words.each\_with\_index do |word, index| characters.each\_with\_index do |character, index2| valid = characters.include?(word[index2]) break unless valid # do whatever you need to do end end If you have characters that can be used in words, you could just loop through all the words, and use your characters list to find if the word would be valid or not. # words.each do |word| characters.
