Tip ****Pretend**** Photoshop and Elements are a single, interrelated program. You can view Elements in the Adobe site and subscribe to Photoshop tutorials, as well as download individual training videos. The app runs about \$100 and can be downloaded from your computer's web browser. # 3D Studio Max 3D Max is arguably the most powerful and sophisticated of the industry standard image editing programs. It is the most complex and expensive program in this book, with an active community of users that, like the industry as a whole, continually upgrades and improves it. One thing you should know about this program is that it requires a powerful computer to run. It's a huge file and runs extremely slow on older computers. You will probably need at least a 1.5GHz processor and at least 1 GB of RAM to run this app. It requires the use of a third-party plugin that must be purchased separately. ## Built-In Editing Tools Photoshop is chock-full of powerful tools that enable you to create and transform your images into works of art. The following list describes the purpose of each tool in the various Photoshop editions. * ****Basic****. This version of Photoshop includes the toolbox, which contains general tools such as the Pen tool and Selection tool, as well as the healing brush and other tools. It includes a set of basic editing tools, such as Levels (see Figure 1-4) and the Hue/Saturation adjustment layer. The Curves and Gradient filters are in the Filter menu.

Q: Why is my char* retaining a string after an assignment? I have a C++ class which is storing a string reference. class TestClass { char* text; public: TestClass(const char* text):text(text) { } }; Testing this I found that the text member is being effectively filled with whatever string is passed. In my case that is 0x4b. I tried to find out what was being assigned to this address with a simple printf("Testing %c", *text) but this only returns "b". This is for a library used for a pretty serious game. This is a bug but it was a really stupid one. The source code was not being checked for string manipulation. I have seen 0x4b appear in previous debug logs after a string was printed out but it never came to me as a meaningful output. A: The text member is a pointer to the first element of an array of characters, so you need to dereference the pointer, like this: printf("Testing %c", *(text+i)); If the string is null-terminated, then it will be at the address 0x4b. A: That's because you need to dereference the pointer (which is the first char in the array). printf("Testing %c", *text); One other thing you should check is if the pointer points to any NULL values. This would cause undefined behaviour which will probably crash the program (due to a pointer not pointing to a valid memory). EDIT: I see that you tagged C++, in that case you can do: printf("Testing %s", *text); That is, use the std::string class and you'll get the desired output. A: printf("Testing %c", *text); You need to dereference the pointer. A: Field of the Invention The present invention pertains to the art of manufacturing wrought metal products and, more particularly, to an apparatus for adjusting the hardness of a metal workpiece. B: Description of the Related Art In the manufacturing of wrought metal products, such as blank steel, the steel is first melted and rolled to form metal billets which are then subjected to

Crying at work? An investigation of everyday psychological stressors and psychological distress among healthcare workers. This cross-sectional study investigated the relationships between everyday stressors in the workplace, psychological distress, and various demographic and occupational variables. A total of 206 healthcare workers completed a questionnaire pertaining to work stressors, psychological distress, work commitment, and demographic and occupational variables. Multivariate analyses showed that 50% of the variance in psychological distress was explained by three different work stressors (colleagues complaining, workload, and work as a problem) and was associated with job satisfaction. Implications for intervention are discussed.Q: How to generate a file that represents the permutation of a given string? I need to generate a given list of strings such as: ["E", "A", "D", "B", "C", "F", "G"] And I want to do it with python. The challenge is: How to generate a file that represents the permutation of a given string? I will explain myself with an example. Take the first permutation of the string "AB". "AB" represents a string: "AB" According to the question, the file "permutations1.txt" should look like this: "C" "B" "A" "D" "B" "A" "C" "A" "B" "D" "A" "B" "C" "A" "A" "D" "A" "A" " " " " It means that in this order the permutation of "AB" is "CBAAD" How can I write a python program that returns this file? A: You could do it like this. Each time you write, you will get a new line. For each line, you can write the result in a file. import string with open("my_list.txt", "w") as f: f.write("".join("".join(l) for l in permutations(my_list))) f.write("".join("".join(l) for l in permutations(my_list))) f.write("".join("".join(l) for l in permutations(my_list))) Here, I assume that your list is stored in the variable
